What is a Signal?

Before we dive into MATLAB, let's clarify what we mean by "signal." In signal processing, a signal is a function that conveys information about a physical phenomenon. Think of it as a way to represent a changing quantity over time or space. Common examples include:

1. **Audio signals:** Sound waves captured by a microphone.

2. **Image signals:** Light intensity variations across a 2D plane.
3. **Radio waves:** Electromagnetic waves used for wireless communication.
4. **Sensor data:** Readings from temperature sensors, pressure sensors, accelerometers, etc.
5. **Economic data:** Stock prices over time.

Signals can be broadly categorized as analog (continuous in time and amplitude) or digital (discrete in time and amplitude). Digital signal processing (DSP) is where MATLAB truly shines, as it's designed to work with discrete-valued data, making it perfect for analyzing and manipulating digitized real-world signals.

Getting Started with MATLAB for Signal Processing

Our MATLAB tutorial for signal processing begins with the basics. If you're new to MATLAB, the first step is to ensure you have it installed. MATLAB is commercial software, so you'll need a license. Many universities and research institutions provide access to their students and faculty.

The MATLAB Environment

Once MATLAB is running, you'll see the main interface, which typically includes several key components:

1. **Command Window:** This is where you type and execute MATLAB commands. It's your primary interaction point for quick calculations and testing.
2. **Editor:** This is where you write and save your MATLAB scripts (.m files). Scripts are sequences of commands that can be executed together.
3. **Workspace:** This window shows all the variables that are currently active in your MATLAB session. You can inspect their values and dimensions here.
4. **Current Folder:** This pane displays the files in the directory your MATLAB session is currently working in.

Your First Signal in MATLAB

Let's create a simple signal and visualize it. We'll start with a basic sine wave. In the Command Window, type the following commands:

```
% Define time vector
Fs = 1000;           % Sampling frequency (samples per second)
t = 0:1/Fs:1-1/Fs; % Time vector from 0 to 1 second

% Define signal parameters
f1 = 50;             % Frequency of the sine wave (Hz)
```

```
amplitude1 = 0.7;    % Amplitude of the sine wave
```

```
% Create the sine wave signal
```

```
signal1 = amplitude1 * sin(2*pi*f1*t);
```

```
% Plot the signal
```

```
plot(t, signal1);
```

```
xlabel('Time (s)');
```

```
ylabel('Amplitude');
```

```
title('Simple Sine Wave Signal');
```

```
grid on;
```

Let's break this down:

1. `Fs = 1000;`: We define our sampling frequency. This is crucial in digital signal processing, as it determines how many samples we take per second to represent our continuous signal. A higher sampling frequency generally leads to a more accurate representation.
2. `t = 0:1/Fs:1-1/Fs;`: This creates a time vector. It starts at 0, increments by the sampling interval ($1/F_s$), and goes up to (but not including) 1 second.
3. `f1 = 50;` and `amplitude1 = 0.7;`: These are the parameters for our sine wave.
4. `signal1 = amplitude1 * sin(2*pi*f1*t);`: This is the core of creating the sine wave. The `sin()` function in MATLAB works with radians, hence the $2\pi f_1 t$ term.
5. `plot(t, signal1);`: This command plots the signal. The first argument is the x-axis (time), and the second is the y-axis (amplitude).
6. `xlabel()`, `ylabel()`, `title()`, and `grid on;`: These are commands to make our plot more informative and readable.

When you run these commands, you'll see a beautiful sine wave plotted in a new figure window. This is your first foray into signal visualization with MATLAB!

Working with Multiple Signals

Signal processing often involves combining or comparing multiple signals. Let's add another sine wave to our mix:

```
% Define another signal
```

```
f2 = 120;    % Frequency of the second sine wave (Hz)
```

```
amplitude2 = 0.3;    % Amplitude of the second sine wave
```

```
signal2 = amplitude2 * sin(2*pi*f2*t);
```

```
% Combine the signals
```

```

combined_signal = signal1 + signal2;

% Plot both signals and the combined signal
figure; % Create a new figure window
subplot(3,1,1); % Create a 3x1 grid of plots, select the first
plot(t, signal1);
title('Signal 1 (50 Hz)');
xlabel('Time (s)');
ylabel('Amplitude');
grid on;

subplot(3,1,2); % Select the second plot
plot(t, signal2);
title('Signal 2 (120 Hz)');
xlabel('Time (s)');
ylabel('Amplitude');
grid on;

subplot(3,1,3); % Select the third plot
plot(t, combined_signal);
title('Combined Signal');
xlabel('Time (s)');
ylabel('Amplitude');
grid on;

```

In this example:

1. We define a second sine wave, `signal2`, with a different frequency and amplitude.
2. `combined_signal = signal1 + signal2;` simply adds the two signals element-wise, demonstrating signal superposition.
3. The `figure;` command ensures our new plots appear in a separate window.
4. `subplot(rows, columns, plot_number);` is a powerful function that allows you to arrange multiple plots within a single figure window. This is incredibly useful for comparing different aspects of your signal processing results.

This exercise demonstrates how easy it is to generate and combine signals in MATLAB, a foundational step for more complex signal manipulation.

Introduction to the Signal Processing Toolbox

While you can create basic signals using core MATLAB functions, the real power for signal processing lies within the dedicated toolboxes. The Signal Processing Toolbox is your gateway to advanced techniques.

Loading and Analyzing Signals

Real-world signal processing often starts with loading existing data. MATLAB can read various audio file formats (like .wav) and other data types. For demonstration purposes, let's assume you have a .wav file named my_audio.wav in your current MATLAB folder. If not, you can easily find example audio files online or generate your own.

```
% Load an audio file
[audio_signal, Fs_audio] = audioread('my_audio.wav');

% Display signal information
disp(['Sampling Frequency: ', num2str(Fs_audio), ' Hz']);
disp(['Number of samples: ', num2str(length(audio_signal))]);
disp(['Signal duration: ', num2str(length(audio_signal)/Fs_audio), '
seconds']);

% Plot the audio signal
time_audio = (0:length(audio_signal)-1)/Fs_audio;
figure;
plot(time_audio, audio_signal);
xlabel('Time (s)');
ylabel('Amplitude');
title('Loaded Audio Signal');
grid on;
```

This code:

1. `audioread('my_audio.wav');` Loads the audio file. It returns the audio data (as a vector) and its sampling frequency.
2. The `disp()` commands provide useful information about the loaded signal.
3. We create a time vector for the audio signal and plot it, similar to our previous example.

Frequency Domain Analysis: The Fast Fourier Transform (FFT)

Understanding a signal in the frequency domain is crucial. The Fast Fourier Transform (FFT) is an efficient algorithm that decomposes a signal into its constituent frequencies. The Signal Processing Toolbox provides the `fft()` function.

```
% Perform FFT on the first sine wave signal
N = length(signal1);           % Number of samples
Y = fft(signal1);              % Compute the FFT
```

```

% Compute the two-sided spectrum P2. Then, calculate the single-sided
spectrum P1.
P2 = abs(Y/N);
P1 = P2(1:N/2+1);
P1(2:end-1) = 2*P1(2:end-1);

% Define the frequency vector for the FFT plot
f_fft = Fs*(0:(N/2))/N;

% Plot the single-sided amplitude spectrum
figure;
plot(f_fft, P1);
xlabel('Frequency (Hz)');
ylabel('|P1(f)|');
title('Single-Sided Amplitude Spectrum of Signal 1');
grid on;

```

Let's break down the FFT code:

1. `N = length(signal1);` Gets the number of samples in our signal.
2. `Y = fft(signal1);` Computes the Discrete Fourier Transform (DFT) using the FFT algorithm. The output `Y` is a complex vector.
3. `P2 = abs(Y/N);` Calculates the magnitude of the FFT result, scaled by the number of samples. This gives us the two-sided amplitude spectrum.
4. `P1 = P2(1:N/2+1);` and `P1(2:end-1) = 2*P1(2:end-1);` This part converts the two-sided spectrum into a single-sided spectrum. For real-valued signals, the negative frequency components are redundant, so we only look at the positive frequencies. We double the amplitudes (except for DC and Nyquist frequencies) to account for the energy from the negative frequencies.
5. `f_fft = Fs*(0:(N/2))/N;` Creates the corresponding frequency axis for our FFT plot.
6. The plot now shows a clear peak at 50 Hz, which is the frequency of our original sine wave. This is a fundamental concept in spectral analysis.

This introduction to FFT is just the tip of the iceberg. MATLAB's Signal Processing Toolbox offers advanced spectral analysis tools like the periodogram and Welch's method for more robust frequency estimation.

Filtering Signals

Filtering is a core operation in signal processing, used to remove unwanted frequencies or extract specific frequency bands. MATLAB provides a wide array of filtering functions.

Let's create a signal that's a mix of two sine waves and then try to filter out one of them.

```
% Create a signal with two frequencies
Fs_filter = 1000;
t_filter = 0:1/Fs_filter:1-1/Fs_filter;
signal_noisy = 0.7*sin(2*pi*50*t_filter) + 0.3*sin(2*pi*120*t_filter);
% Add some random noise
signal_noisy = signal_noisy + 0.1*randn(size(t_filter));

% Design a low-pass filter
cutoff_freq = 80;          % Cutoff frequency in Hz
filter_order = 4;          % Order of the filter

% Use the butter() function to design a Butterworth low-pass filter
% Wn is the normalized cutoff frequency (cutoff_freq / (Fs/2))
Wn = cutoff_freq / (Fs_filter/2);
[b, a] = butter(filter_order, Wn, 'low');

% Apply the filter to the noisy signal
filtered_signal = filter(b, a, signal_noisy);

% Plot original, noisy, and filtered signals
figure;
subplot(3,1,1);
plot(t_filter, signal_noisy);
title('Noisy Signal');
xlabel('Time (s)');
ylabel('Amplitude');
grid on;

subplot(3,1,2);
plot(t_filter, signal_noisy); % Plot noisy again for comparison
hold on; % Keep the current plot and add to it
plot(t_filter, filtered_signal, 'r'); % Plot filtered signal in red
title('Noisy Signal vs. Filtered Signal');
xlabel('Time (s)');
ylabel('Amplitude');
legend('Noisy', 'Filtered');
grid on;
hold off;
```

```
subplot(3,1,3);
plot(t_filter, filtered_signal);
title('Filtered Signal');
xlabel('Time (s)');
ylabel('Amplitude');
grid on;
```

In this filtering example:

1. We create a `signal_noisy` by combining two sine waves (50 Hz and 120 Hz) and adding some random noise using `randn()`.
2. `butter(filter_order, Wn, 'low')`: This is a key function from the Signal Processing Toolbox. It designs a Butterworth digital filter. We specify the filter order, the normalized cutoff frequency (where $F_s_{\text{filter}}/2$ is the Nyquist frequency), and whether it's a 'low' pass filter. It returns the filter coefficients `b` (numerator) and `a` (denominator).
3. `filtered_signal = filter(b, a, signal_noisy);` This applies the designed filter to our noisy signal using the calculated coefficients.
4. The plots clearly show how the low-pass filter has attenuated the higher frequency (120 Hz) and the noise, leaving a signal closer to the original 50 Hz component.

MATLAB offers various filter design methods (Chebyshev, Elliptic, FIR filters) and analysis tools to help you choose the best filter for your specific application.

Understanding Signals in MATLAB

Before diving into MATLAB, it's essential to grasp the core concepts of signals. A signal is generally a function that conveys information about a phenomenon. In signal processing, we often deal with discrete-time signals, which are sampled at regular intervals from a continuous-time signal. MATLAB is particularly adept at handling discrete-time signals represented as vectors or matrices.

Types of Signals:

1. **Continuous-Time Signals:** Functions of a continuous variable, typically time.
2. **Discrete-Time Signals:** Functions of a discrete variable, typically sampled time indices.
3. **Analog Signals:** Continuous in both time and amplitude.
4. **Digital Signals:** Discrete in both time and amplitude (quantized).
5. **Deterministic Signals:** Signals whose future values can be predicted precisely.

6. **Random Signals:** Signals whose future values cannot be predicted precisely and are described by statistical properties.

In MATLAB, discrete-time signals are most commonly represented by arrays (vectors). The sampling rate of a signal is a critical parameter, determining how frequently the continuous signal is sampled. This is often denoted by F_s (sampling frequency).

Getting Started with MATLAB: Basic Signal Generation

Our MATLAB tutorial begins with generating basic signals. This is fundamental to understanding how different signal properties manifest in the digital domain.

Generating a Sine Wave:

A sinusoidal wave is a ubiquitous signal. We can generate it in MATLAB using the following steps:

1. **Define parameters:** Amplitude (A), frequency (f), sampling frequency (F_s), and duration (T).
2. **Create a time vector:** This vector represents the discrete time points at which the signal is sampled.
3. **Generate the sine wave:** Apply the sine function using the time vector.

Here's a sample MATLAB code snippet:

```
% Signal parameters
A = 1;           % Amplitude
f = 10;          % Frequency (Hz)
Fs = 1000;       % Sampling frequency (Hz)
T = 1;           % Duration (seconds)

% Create time vector
t = 0:1/Fs:T-1/Fs;

% Generate the sine wave
signal = A * sin(2 * pi * f * t);

% Plot the signal
figure;
plot(t, signal);
title('Generated Sine Wave');
xlabel('Time (s)');
ylabel('Amplitude');
```

```
grid on;
```

This code generates a sine wave with an amplitude of 1, a frequency of 10 Hz, sampled at 1000 Hz for 1 second. The resulting plot allows you to visualize the wave's characteristics.

Other Basic Signals:

You can similarly generate other fundamental signals like cosine waves, square waves, sawtooth waves, and impulse signals using MATLAB's built-in functions or by constructing them programmatically. For instance, a simple impulse at time $n=0$ would be a vector with a 1 at the first element and 0s elsewhere. Understanding the generation of these basic building blocks is crucial for understanding more complex signal synthesis and analysis.

Introduction to the Signal Processing Toolbox

MATLAB's Signal Processing Toolbox is an indispensable asset for anyone working with signals. It offers a comprehensive suite of functions for designing, analyzing, and implementing signal processing algorithms.

Key Functions and Capabilities:

1. **Filtering:** Designing and applying various types of filters (e.g., low-pass, high-pass, band-pass, band-stop). This is critical for removing noise, isolating specific frequency components, or shaping the signal's spectrum. Common functions include `filter`, `designfilt`, and specific filter design functions like `butter`, `cheby1`, `ellip`, etc.
2. **Spectral Analysis:** Analyzing the frequency content of signals. This includes computing the Fast Fourier Transform (FFT) using `fft` and `fftshift`, and power spectral density (PSD) estimation using functions like `periodogram`, `pwelch`, and `cpsd`.
3. **Windowing:** Applying window functions (e.g., Hamming, Hanning, Blackman) to mitigate spectral leakage during FFT analysis. Functions like `hamming`, `hanning`, and `blackman` are readily available.
4. **Sampling and Resampling:** Converting between different sampling rates using `resample` and `downsample`/`upsample`. This is vital in many communication and audio processing applications.
5. **Signal Generation:** Beyond basic sine waves, the toolbox offers functions for generating various waveforms, including chirp signals, white noise, and specific modulation schemes.
6. **Correlation and Convolution:** Analyzing the similarity between signals (`xcorr`) or applying linear systems (`conv`).

Example: Applying a Low-Pass Filter

Let's demonstrate how to apply a simple low-pass filter to our generated sine wave to remove higher frequency components. Assume we add some noise first.

```
% Generate a noisy sine wave
noise_amplitude = 0.5;
noisy_signal = signal + noise_amplitude * randn(size(t)); % Add
Gaussian noise

% Design a low-pass filter
cutoff_frequency = 20; % Hz
filter_order = 2;
[b, a] = butter(filter_order, cutoff_frequency / (Fs/2), 'low'); %
Butterworth low-pass filter

% Apply the filter
filtered_signal = filter(b, a, noisy_signal);

% Plot original, noisy, and filtered signals
figure;
plot(t, noisy_signal, 'b', 'DisplayName', 'Noisy Signal');
hold on;
plot(t, filtered_signal, 'r', 'DisplayName', 'Filtered Signal');
plot(t, signal, 'g--', 'DisplayName', 'Original Signal');
title('Noise Reduction using Low-Pass Filter');
xlabel('Time (s)');
ylabel('Amplitude');
legend;
grid on;
```

This example highlights how easily you can implement noise reduction techniques. The ``butter`` function designs a Butterworth filter, and ``filter`` applies it to the noisy signal. The comparison clearly shows the effectiveness of the filtering process.

Spectral Analysis with FFT

Understanding the frequency components of a signal is crucial. The Fast Fourier Transform (FFT) is the primary tool for this. It decomposes a signal into its constituent frequencies.

Performing an FFT in MATLAB:

The `fft` function computes the discrete Fourier transform. It's important to remember that `fft` produces a complex-valued output, and the results are symmetric for real-valued input signals. `fftshift` is often used to center the zero-frequency component.

```
% Compute the FFT
N = length(signal); % Number of samples
Y = fft(signal);

% Compute the corresponding frequencies
f_axis = Fs * (0:(N/2))/N; % For single-sided spectrum

% Compute the magnitude of the FFT (single-sided spectrum)
P1 = abs(Y/N);
P1 = P1(1:N/2+1);
P1(2:end-1) = 2*P1(2:end-1);

% Plot the frequency spectrum
figure;
plot(f_axis, P1);
title('Single-Sided Amplitude Spectrum of Sine Wave');
xlabel('Frequency (Hz)');
ylabel('Amplitude');
grid on;
```

This code calculates and plots the single-sided amplitude spectrum of our sine wave. You should observe a clear peak at the signal's frequency (10 Hz), demonstrating the power of FFT in identifying dominant frequencies.
